HTML & CSS
PROJECT DOCUMENTATION

Three Web Development Practical Projects

Projects included

1. Gym Website
2. College Fest Website
3. Restaurant Website

Prepared from the HTML and CSS files supplied for this assignment.

Introduction

This document explains three beginner-level web development projects created using HTML and CSS. HTML arranges the content on a webpage, while CSS controls its appearance, including colors, fonts, spacing and alignment. Each project contains an introduction or question, a simple explanation of the code, an output screenshot and a conclusion.

How to view the projects

Keep each HTML file and its related CSS file in the same folder. Open the HTML file in a web browser. The stylesheet name in the HTML link must match the actual CSS filename. For the screenshots in this document, the supplied CSS was embedded into a temporary preview of each HTML page; the original uploaded files were not changed.

Restaurant Website

1. Introduction / Question

Create a simple restaurant webpage that displays restaurant information, food items and prices, chef details, customer feedback, opening hours, a table-booking form and contact information.

2. Explanation in Simple Words

HTML file: The HTML file provides the page structure. The head section sets the page title and connects cafe.css. The body contains a main heading, navigation links, welcome text, menu items, chef and review details, opening hours, a booking form, contact details and a footer.

CSS file: The CSS sets an aqua page background and Arial font, centers the content, styles the main heading with a brown background and white text, creates a black navigation bar, colors section headings brown, gives the form a white background, and styles the button and footer.

Files used: cafe.html — page content; cafe.css — page design.

3. Output

The output is a centered restaurant webpage with an aqua background, a brown title bar, a black navigation bar, menu and restaurant information, a white booking form, and a brown footer.

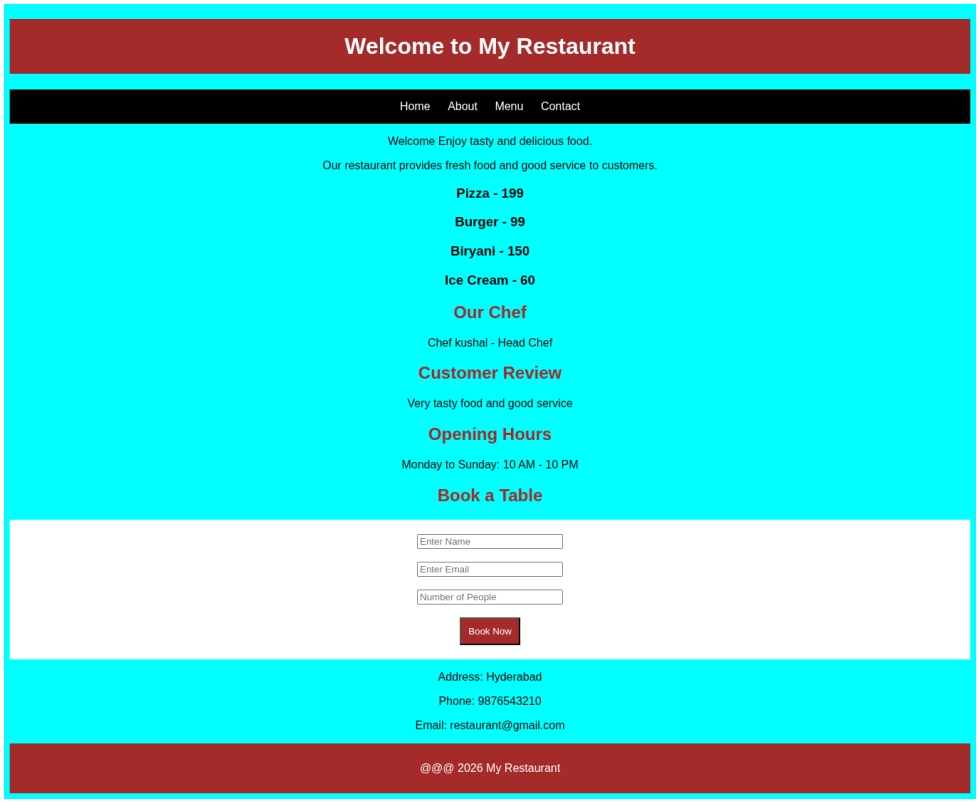

Figure: Browser output generated from the supplied HTML and CSS.

4. Conclusion

This project demonstrates how HTML presents restaurant details and a booking form, while CSS makes the page colorful and organized.

College Fest Website

1. Introduction / Question

Create a college fest webpage to present the fest title, technical and cultural events, workshops, event timings, coordinators, rules and a student registration form.

2. Explanation in Simple Words

HTML file: The HTML file defines the page title and links the stylesheet as style.css. The body contains a header with the fest name and tagline, navigation links, event categories, a schedule table, fest rules, a registration form and a footer. The schedule uses table rows and cells to organize time, event and coordinator details.

CSS file: The stylesheet uses a light-yellow page background and Arial font, centers the text, gives the main heading a brown background with white text, styles navigation with a black background and white links, colors h2 headings brown, and adds white form styling plus brown buttons and footer.

Files used: college fest(1).html — page content; style(1).css — page design. The HTML refers to style.css, so the preview uses that linked filename.

3. Output

The output is a college fest information page with a light-yellow background, a brown heading area, a black navigation bar, event and workshop lists, a schedule table, fest rules, a registration form and a footer.

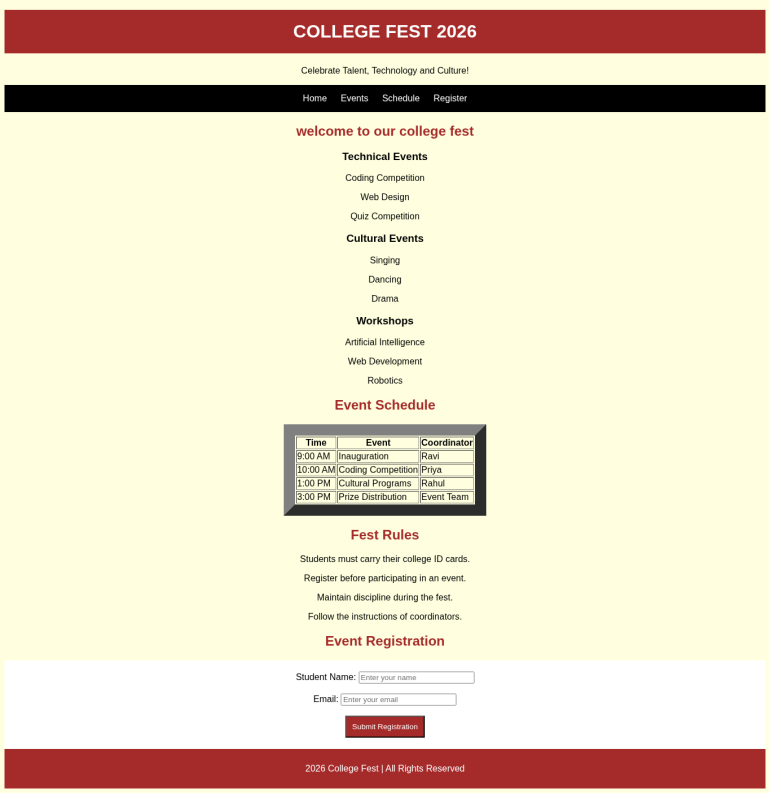

Figure: Browser output generated from the supplied HTML and CSS.

4. Conclusion

This project demonstrates how HTML lists event information and organizes a schedule in a table, while CSS provides a consistent design.

Gym Website

1. Introduction / Question

Create a basic fitness center webpage that introduces the gym, lists workout programs and membership plans, identifies a trainer and provides a simple registration area.

2. Explanation in Simple Words

HTML file: The HTML file sets the page title, character encoding and stylesheet link. The body contains a div with class ss. Inside it are the gym heading, welcome message, workout programs, membership prices, trainer information and name/email input fields with a Join Now button.

CSS file: The CSS centers body text and uses Arial. It sets background colors and background-image declarations, styles the h1 with a black background and white text, colors h2 headings red, styles the button orange, and makes paragraph text blue. The second body rule overrides the earlier body background-image settings. The selector ss is an element selector, not the class selector .ss used in the HTML.

Files used: main gym(1).html — page content; main(2).css — page design. The HTML refers to main.css, so the preview uses that linked filename.

3. Output

The output is a centered gym information page showing workout programs, three membership plans, trainer details and registration inputs. The background image may not appear because the final CSS refers to a local d.jpg file that was not included with the uploads.

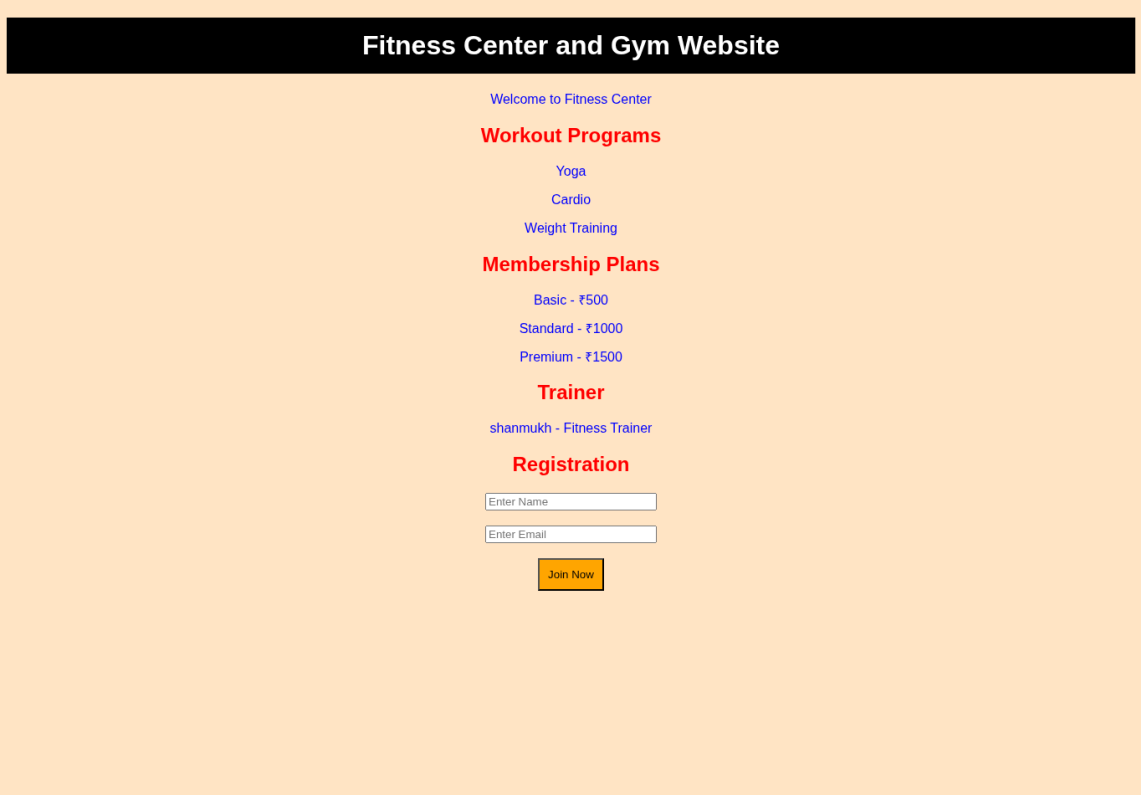

Figure: Browser output generated from the supplied HTML and CSS.

4. Conclusion

This project demonstrates how HTML presents fitness programs, membership plans and registration fields, while CSS controls text alignment, colors and button appearance.
